Relationship Is A Cause Of Alzheimer's Disease and Dementia

November 10, 2020

Can relationship be the main cause of Alzheimer's disease, as well as the Parkinson's disease and dementia? Such diseases are still poorly understood. On the opinion of the Worldtypology.com these are the most terrible diseases of mankind. For many years, huge funds allocated only to find out the reasons why these diseases occur.

**Main Cause Of Alzheimer's, Parkinson's And Dementia
Lies In Relationship**

We also tried to study the question about the causes of these terrible diseases. Now we must say, that 9 out of 10 patients with such diseases have some bad close relationships. What do we mean by that and why it is related to the new cause of Alzheimer's?

We discovered, that such people have some specific type of relationship that exerts constant pressure on a sick person. What kind of pressure? This pressure is not necessarily aggressive. This kind of pressure affects the sick person and constantly makes him feel hopeless and afraid.

Alzheimer's Disease. What Type Of Relationship Causes It?

The relationship that causes Alzheimer's disease we call "Dominating relationship (D)". It is described here. According to our theory, the purpose of this relationship is that one specific innate type of personality has unconscious pressure on another specific type.

Therefore, such constant pressure stimulates the fear in the weak side of such a relationship. It also stimulates some constant work of protective mechanisms in the psyche and health of the injured person. Such protective mechanisms lead to constant fear, anxiety and negatively influence the memory, making it weak after a long time.

From This It Logically Follows, If That Is The New Cause Of Alzheimer's, Than Separation Of These People Is Necessary For Both

It is better to distance them on a permanent basis, because we think that these protective mechanisms will work more actively over time. The strong side does not feel anything, but at the same time – does not understand the weak side.

Many people think that the weak side can refuse such contact. But according to our observations, such a choice is very difficult. A weak side is always feeling constant influence and depends on the decision of the strong side.

This leads to memory loss, loss of control over the body's own physiological functions. And this is especially true for people in older age. The work of defense mechanisms only increases and accumulates over time. That is why it is important to remove this contact from the chain and never meet with them again.

Other Types Of Dementia And Parkinson's Disease May Have The Same Causes As Described Above. But Our Research Is Just A Beginning

Therefore, we do not yet have scientific evidence that separation will actually help someone with Alzheimer's, dementia, or Parkinson's disease. We do not

have any evidence yet that they will get their health, memory and behavior back to normal. Such research has not yet been carried out. The purpose of this article is to attract the attention of doctors and stimulate them to do such research.

Before to start, you need to understand the main thing. It is important to know, which of the close people is an irritant for a patient.

This is not an easy task. Because some patients will never tell you about their unconscious fear of a close person. A patient may hide such feeling or lie to you.

Other family members (including strong side of relationship) may not realize the reason of illness. That is why they won't agree that the patient is afraid of them. Such people usually cannot feel any fear or inner condition of a close person suffering from such diseases. Therefore, a patient will continue to suffer and it will get worse.

We also think that "Educative relationship (E)" (as we call it) may also be cause for dementia and Parkinson's disease in the long term.

Important update!

Since October 12, 2023, we are changing the policy of free testing for all people. From now, only people who have middle or severe stage of Alzheimer's disease, dementia or Parkinson's disease will be able to get a free typological analysis here (not typology test).

Their families, relatives, other people and people who have an early stage of dementia, Alzheimer's or Parkinson's disease will have to pay for the typology test and complete it on themselves.

Remember! We are not psychiatrists and our services are not of medical or psychological character. We research facts in human innate types of thinking, inborn personality types and their relationships.

The cause of Alzheimer's disease, dementia and Parkinson's was discovered by independent researchers Viktor Dudkevych, and engineer Olha Kovalchuk in 2020.
